| ABDM HealthRecordBundle alignment | ready  | Ready for demo evidence          |
| ABHA identifier presence          | gap    | No real identifier; synthetic... |

Receiver handover notes

ABDM readiness view; ABHA identifier is flagged because no real national identifier exists for synthetic data.  
The receiving Indian system can store accepted ConceptMap mappings in its local learned cache for reuse.

Interoperability note

This PDF is a human-readable rendering. The interoperable source of truth is the HL7 FHIR IPS-style Bundle and its coded Condition, Observation, and MedicationStatement resources. Readiness checks are shown for judge review only; no formal national profile certification is claimed.
