

Cross-Border IPS AI Agent - Architecture

FHIR IPS is the interoperable artifact; PDFs are human-readable renderings.

Interoperability and privacy evidence

Semantic interoperability: SNOMED CT, ICD-10, LOINC, RxNorm, and FHIR ConceptMap.

Data interoperability: Patient, Condition, Observation, MedicationStatement, Composition, and Bundle.

Federated privacy boundary: raw reports, labels, aliases, identifiers, and patient-level Bundles stay local.

Coordinator receives model tensors and sample counts only. FedAvg is data locality, not formal privacy.
